2021 - Present

Machine Learning Engineer (4 Years of experience at LSPORTS)

Ashkelon, Israel

- **Part of the data science and computer vision team**, developing a Tennis game Data extractor using more than 10 different deep learning networks trained using **Pytorch** and deployed using **Tensorrt** and **Dynamo-Triton inference server**.
- Have experience with video networks with **3D convolutions** – used one to detect ground-hit of the tennis ball.
- Developed and automated tools for training, annotating and testing **Deep Learning models** and data.
- Utilized different **YOLO** architectures and the **MMOCR** library to extract match and player statistics from video streams in real time.
- Deployed deep learning orchestration of multiple models using Nvidia tools for deployment such as **Nvidia Tensorrt and Dynamo-Triton inference server**.
- Leveraged **GIT&GIT-LFS** for version control of code and weights throughout all these processes.
- Leveraged **Docker** for smoother deployment process.

EDUCATION

SCE College of Engineering — **2022 Graduate**

B.Sc. Software Engineering on **Data Science** inter-disciplinary field. — Be'er Sheva, Israel

SKILLS, LANGUAGES & TOOLS

- Languages: **Python – Very high proficiency** (with strong emphasis on **Object-Oriented Programming** and deep learning training and implementation using **Pytorch**), C++, SQL – decent control.
- Experienced with micro services concepts and design.
- Experienced with Nvidia tools for deployment – **Nvidia Dynamo-Triton inference server, Tensorrt.**
- Proficient with **GIT&GIT-LFS** for version control. Experience with **Docker** for creating and managing containers for deployment.
- Solid understanding of Data Science algorithms, with practical experience from current role.
- Implemented **comprehensive test cases using Pytest framework**, ensuring software quality and robustness.

PROJECTS

Ground-hit detector.

- Used 3D-Unet to detect ground-hits of the tennis ball during match – from the data labeling process to training using **Pytorch** and implementation in the relevant service using **Nvidia Dynamo-Triton inference server**.

Cryptocurrency price predictions.

- Developed a Twitter and Binance scrapers using Python and respective APIs. Trained an **LSTM** neural network to predict Bitcoin trends, with results surpassing competitors (intotheblock).

On my free time - Kaggle challenges.

- **1st** in class in 2/4 challenges (see on my Kaggle page).

Analysis and classification of Tweets (from Twitter) data file using the below ML architechtures.

- **XGBoost, ID3, SVM, Random forest and simple Linear Regression.**

ARMY SERVICE & VOLUNTEERING

- **Full military service as a combat soldier & staff sergent at Giva'ti brigade – more than 270 days in reserve since october 7 attack.**
